

WEB-BASED IMAGING SERVICE CAPABLE OF BEING TRAINED TO PROVIDE
MANUAL DUPLEX PRINTING

ABSTRACT OF THE DISCLOSURE

In a web based imaging environment, a user accesses a destination service representing a printer having manual duplex printing capability, and selects a manual duplex option. If the selected printer is unfamiliar to the destination service, it guides the user through a training process describing the paper input path of the printer. The destination service prints an image on a page, asks the user to reload the page in a certain orientation and prints an image on the page again. The user provides feedback about the orientations of the printed images, which the destination service uses to formulate instructions to later guide the user through manual duplex printing using the selected printer. In a variation, the destination service stores the manual duplex instructions formulated for various printers, thus avoiding the need to retrain.
